When the air-fuel ratio is lower than the stoichiometric ratio, the air-fuel mixture is called rich. For example, for a gasoline engine, an AFR of 16.5:1 is lean and 13.7:1 is rich. In the table below we can see the stoichiometric air-fuel ratio for several fossil fuels.

Amount of fuel plus enrichment =  $(6.5:1) / (3.4:1) = 1.91$  or 91-percent rich. The actual ratio of the weight of air to the weight of fuel was computed over several test runs by using an MFI fuel injection jetting calculator. Fuel injection jetting was adjusted until an optimum spark plug reading was achieved.
