Growth of bone • Long bones grow from the epiphyseal plate (growth plate) at each end. • Both ends grow, but generally one end will grow faster than the other. • Example: distal epiphysis of the femur & proximal epiphysis of the tibia contribute roughly 60% of limb length, but proximal epiphysis of the humerus contribute 80% of humeral length.

### Introduction to Orthopedic Anatomy

Compact bone is the hard material that makes up the shaft of long bones and the outside surfaces of other bones. Compact bone consists of cylindrical units called osteons. Each osteon contains concentric lamellae (layers) of hard, calcified matrix with osteocytes (bone cells) lodged in lacunae (spaces) between the lamellae.
