Entrance-Exit Interlocking (NX) was the original brand name of the first generation relay-based centralized traffic control (CTC) interlocking system introduced in 1936 by GRS (represented in Europe by Metropolitan-Vickers). The advent of all electric interlocking technology allowed for more automated route setting procedures as opposed to having an operator line each part of the route manually.

Interlocking - Wikipedia

In railway signalling, an interlocking (IXL) is a system composed by a set of signal apparatus that prevents trains from conflicting movements through only allowing trains to receive authority to proceed, when routes have been set, lock and detected in safe combinations. The main function carried out by an interlocking system is to set and lock routes related to each train located in an

Zone Selective Interlocking (ZSI) is a communication scheme used with electronic trip units and electronic protective relays for circuit breakers to improve the level of protection in a power distribution system. This is achieved through communication between the down- stream and upstream devices in a power distribution system.
