For the traditional use of press fits, where the pins both join and accurately locate the parts, better designs use slip-fit dowel pins for self-locating and bolts to join the parts. In plastics, use locating pins for alignment and snap fits for assembly.

The recommended binder pressure for round draws of low-carbon draw-quality steel is 600 pounds per lineal inch around the post (draw post diameter x 3.141). For high-strength, low-alloy, and stainless steels, 1,800 pounds of pressure per lineal inch should be used.

### Key design principles for successful deep drawing

The goal is, by design, to have the tool naturally want to close evenly on all four corner die stops. Balance the tooling forces under the press ram. Remember, every tool and press has some lateral play, which in turn affects stability and tooling life. The tool guide pins and bushings need to be robust enough to overcome these lateral forces.

The first design factor is size. Press-fit assembly involves the insertion of one part that is slightly larger than the mating hole. The assembly stays in place through friction and the force of the two parts pushing against each other.

The press brake contains an upper tool called the punch and lower tool called the die between which the sheet metal is placed. The sheet is placed between the two and held in place by the backstop. The bend angle is determined by the depth that the punch forces the sheet into the die.
