In the context of software engineering, software quality refers to two related but distinct notions: Software functional quality reflects how well it complies with or conforms to a given design, based on functional requirements or specifications. That attribute can also be described as the fitness for purpose of a piece of software or how it compares to competitors in the marketplace as a worthwhile product. It is the degree to which the correct software was produced. Software structural quality

Quality assurance is the process of defining how software quality can be achieved and how the development organization knows that the software has the required level of quality. The main activity of the quality assurance process is the selection and definition of standards that are applied to the software development process or software product.

**Chapter 12. Software quality management**  
To summarize, software design quality could be measured effectively by viewing a design problem from following three different views: ilty-view (where the design problem impacts certain quality attributes of the software design), principle-view (where the problem violate one or more design principles), and constraints-view (where the problem violates one or more constraints imposed by the context).
