To summarize: The NP test for $H: \mu = \mu_0$ versus $K: \mu \neq \mu_0$ rejects when: $T(X) \geq c$. We now make two observations: First, this is still a valid test for $H: \mu \leq \mu_0$, since for any $\mu \leq \mu_0$, we have that: $P_{\mu}[T(X) \geq c] = 1 - \Phi\left(\frac{c - \mu}{\sigma/\sqrt{n}}\right) \geq 1 - \Phi\left(\frac{c - \mu_0}{\sigma/\sqrt{n}}\right) = \alpha$. Thus it must also be UMP for $H: \mu \leq \mu_0$.

In statistical analysis, we have to make decisions about the hypothesis. These decisions include deciding if we should accept the null hypothesis or if we should reject the null hypothesis. Every test in hypothesis testing produces the significance value for that particular test. In Hypothesis testing, if the significance value of the test is greater than the predetermined significance level, then we accept the null hypothesis.
